What is Southern design?

By Kevin Murray

Conventionally, design is a form of development that trickles down from the North to the South. But the strength of tradition in Southern cultures provides rich resources.

The principle challenge in identifying a southern approach to design is justifying a regional approach. The idea of globalisation encourages a concept of the flat world, where all locations
are equal. Thomas Friedman begins The World is Flat 3.0 (2007) with a description from a
golf course in Bangalore, India’s Silicon Valley, surrounded by the icons of US corporate
capital – Epson, Microsoft, IBM, etc. The ubiquity of social networks suggests that place no
longer matters. From this perspective, the idea of different worlds in the North and South
seems like a vestige of Cold War thinking. While we do live in an era of emerging markets,
when China will soon become the largest economy in the world, it can be argued that the
north-south hierarchy is embedded in to the foundational beliefs of the modern world.

The history of design education in the South is commonly an extension of northern design. In
1958, Charles and Ray Eames were commissioned by the Indian government to write a report
on design, which became the basis for the National Institute of Design in Ahmedabad. Their
India Report (Eames and Eames 1958) praised vernacular designs in folk crafts, reflected in
the extensive research archive that has since been developed at NID. But the resulting
aesthetic in NID is predominantly industrial, with little space for the more ornate traditions
that constitute Indian decorative arts.

The history of design in Latin America follows a parallel path. Adelia Borges’ history of
Brazilian design (Borges 2014) maps a similar arrival of Northern knowledge in the
establishment in 1963 of the Escola Superior de Desenho Industrial (ESDI – Superior School
of Industrial Design) in Rio de Janeiro. This school was based on the Ulm School of Design
Hochschule für Gestaltung Ulm, in Germany, that professed ideas of ‘good form’ or ‘good
design’. In the implementation of modernist values, the range of vernacular crafts in Brazil
was overlooked.

Histories of design in the South are mostly ‘trickle down’ narratives of disciplines that were
imported from Northern centres. Design readily falls into a neo-colonial discourse following a
modernist path of inevitable progress that is spread across the South, as part of the
developmental package along with science, medicine, education and technology.

An autonomous concept of design in the South needs to include features that are more
developed than that North. I use ‘developed’ in the broader sense of complex and widely
adopted. One North-South axis that positions a distinctive South is modern-traditional.

The standard developmental narrative of colonization involves the victory of adult reason
over childish magical thinking. This is particularly obvious in medicine, where scientifically
tested drugs and procedures replace witchcraft and superstition. But even in conventional
medicine there is now increasing awareness of the role that hope plays in recovery from
illness (Godin 2014). The placebo effect is becoming less a methodological error and more a
serious factor in overcoming disease and injury.
